1 TECHNICAL REPORT FOR STATIC ASSESSMENT

1.1 INTRODUCTION

The topic of this static assessment is global analysis of new steel structure near the experimental cell. Calculation of the internal forces of the main components, check connections and assessment anchoring to the foundation concrete slab. Foundation of concrete cell is not subject of this static assessment. Static calculation is prepared in scope of project for detail design with respect all of allowed norm EN.

In static calculation are documented only necessarily output for design structures. Completed detailed outputs are compiled and will be printed and added on demand.

1.2 DESCRIPTION OF STRUCTURE

This is two floor steel structure = Control hatch. Dimension of steel structure is 9,14 x 4,44 m and height 6,441 m dimensions are dimensioned on axis of profile. Level of first floor is on level -3,000, level of axis beam for second floor is on level +0,411 and axis of roof beam is on level +3,361.

Columns are designed from profile HEB 140. Longitudinal beams on second floor and on the roof, are from profile IPE 160. Cross beams will be designed from IPE 140 and the outer beam will be from UPE 140.

1.3 MATERIALS USE IN BEARING STRUCTURE

- Steel beams S235

All products on site must have valid certificates.

1.4 LOAD USE IN CALCULATION

| | | |
|--------------------------------|-------------|------|
| - Self-load bearing structures | coefficient | 1,35 |
| - Dead load | coefficient | 1,35 |
| - Active load | coefficient | 1,50 |

1.5 PROCEED CALCULATION AND MODELING

For design and modeling was prepared simple spatial structure of the whole steel structure. Spatial model is composed from beams.

The connections are rigid as well as articulated. The laying of the hall is considered articulated.

Load in each load condition was set in characteristic value, corresponding coefficient was used during making of load combination.

1.6 USED NORM, SOFTWARE AND BASES

Norm:

- EN 1990 Basis of structural design
- EN 1991-1-1 General actions - Densities, self-weight, imposed loads for buildings
- EN 1993-1-1 Design of steel structures - Part 1-1: General rules and rules for buildings

Bases:

- Project documentation of building part

Software:

- RFEM5 – Calculations of spatial structures using finite element method, Dlubal Praha
- FIN EC – Steel
- FIN EC – Steel connection

|----------|---|------------|---------------|---|------------|
| N_{Sk} | = | 0,000 [kN] | δ_N | = | 0,000 [mm] |
| V_{Sk} | = | 0,808 [kN] | δ_V | = | 0,065 [mm] |
| | | | δ_{NV} | = | 0,065 [mm] |

Comments: Tension displacements are valid with half of the required installation torque moment for uncracked concrete! Shear displacements are valid without friction between the concrete and the baseplate! The gap due to the drilled hole and clearance hole tolerances are not included in this calculation!

The acceptable anchor displacements depend on the fastened construction and must be defined by the designer!

6 Warnings

- The anchor design methods in PROFIS Anchor require rigid baseplates per current regulations (ETAG 001/Annex C, EOTA TR029, etc.). This means load re-distribution on the anchors due to elastic deformations of the baseplate are not considered - the baseplate is assumed to be sufficiently stiff, in order not to be deformed when subjected to the design loading. PROFIS Anchor calculates the minimum required baseplate thickness with FEM to limit the stress of the baseplate based on the assumptions explained above. The proof if the rigid baseplate assumption is valid is not carried out by PROFIS Anchor. Input data and results must be checked for agreement with the existing conditions and for plausibility!
- Checking the transfer of loads into the base material is required in accordance with EOTA TR 029, Section 7!
- The design is only valid if the clearance hole in the fixture is not larger than the value given in Table 4.1 of EOTA TR029! For larger diameters of the clearance hole see Chapter 1.1. of EOTA TR029!
- The accessory list in this report is for the information of the user only. In any case, the instructions for use provided with the product have to be followed to ensure a proper installation.
- Characteristic bond resistances depend on short- and long-term temperatures.
- Please contact Hilti to check feasibility of HIT-V rod supply.
- Edge reinforcement is not required to avoid splitting failure

Fastening meets the design criteria!

7 Installation data

Baseplate, steel: -

Profile: IPBi/HEA; (L x W x T x FT) = 133 mm x 140 mm x 6 mm x 9 mm

Hole diameter in the fixture: $d_f = 14$ mm

Plate thickness (input): 10 mm

Recommended plate thickness: not calculated

Drilling method: Hammer drilled

Cleaning: Compressed air cleaning of the drilled hole according to instructions for use is required

Anchor type and size: HIT-RE 500 V3 + HIT-V(5.8) M12

Installation torque: 0,040 kNm

Hole diameter in the base material: 14 mm

Hole depth in the base material: 120 mm

Minimum thickness of the base material: 150 mm

7.1 Recommended accessories

Drilling

- Suitable Rotary Hammer
- Properly sized drill bit

Cleaning

- Compressed air with required accessories to blow from the bottom of the hole
- Proper diameter wire brush

Setting

- Dispenser including cassette and mixer
- Torque wrench

8 Remarks; Your Cooperation Duties

- Any and all information and data contained in the Software concern solely the use of Hilti products and are based on the principles, formulas and security regulations in accordance with Hilti's technical directions and operating, mounting and assembly instructions, etc., that must be strictly complied with by the user. All figures contained therein are average figures, and therefore use-specific tests are to be conducted prior to using the relevant Hilti product. The results of the calculations carried out by means of the Software are based essentially on the data you put in. Therefore, you bear the sole responsibility for the absence of errors, the completeness and the relevance of the data to be put in by you. Moreover, you bear sole responsibility for having the results of the calculation checked and cleared by an expert, particularly with regard to compliance with applicable norms and permits, prior to using them for your specific facility. The Software serves only as an aid to interpret norms and permits without any guarantee as to the absence of errors, the correctness and the relevance of the results or suitability for a specific application.
- You must take all necessary and reasonable steps to prevent or limit damage caused by the Software. In particular, you must arrange for the regular backup of programs and data and, if applicable, carry out the updates of the Software offered by Hilti on a regular basis. If you do not use the AutoUpdate function of the Software, you must ensure that you are using the current and thus up-to-date version of the Software in each case by carrying out manual updates via the Hilti Website. Hilti will not be liable for consequences, such as the recovery of lost or damaged data or programs, arising from a culpable breach of duty by you.

3 CONCLUSION

The steel structure is designed with respect all of allowed EN norm. From the calculation. From the calculation above, it is clear the hall is designed safely and suitably.
